## Projects

### RedeFinance:

This application was created to help keep track of expenses and income. Users enter their expenses through various rates that recur by month or year. Users also enter their income, then the application calculates their monthly income and shows how much available income they have to spend. Technologies used to create this app include MongoDB to handle data, JavaScript, Express.js and Node.js for routing and logic, JWT and Bcrypt for user authentication, and React and Material-UI, for visual content.

<https://github.com/MAIMBRAIN/RedeFinance>

### Movie Watchlist:

This application is for those who receive many movie suggestions and struggles with keeping track of them. The user is required to make an account and then the application will allow users to search movies from the OMDB API and save them to a list. The user can visit their watchlist and cross them off once they have watched the movie, or delete the movie if they choose not to watch it in the future. Technologies used to create this application include JavaScript and JQuery for logic, MySQL to handle data, and Materialize and Handlebars for visual content. <https://github.com/Massiel50/bamf>

### APPetite:

This application works for a broad amount of users who have encountered the daunting situation where they have various ingredients, but it seems as if there is nothing to do with them. The user will be prompted to insert a food item or ingredient and then the application will provide recipes queried from the Edamam API and The Cocktail DB API. Technologies used to create this application include JavaScript and JQuery for logic, and Foundation, Materialize, and Animate on Scroll for visual content.
